Изучен видовой состав жуужелиц Южного Дагестана. Впервые для района исследования приводится 386 видов жуужелиц, относящихся к 74 родам.

Ground beetles of the South Daghestan are studied. For the first time for the territory there are defined 386 species of the beetles related to 74 Genus.

Ключевые слова: Южный Дагестан, жуужелицы, Carabidae, состав, фауна.

Полные сведения о составе фауны того или иного региона можно привести лишь на основе исчерпывающих данных всестороннего анализа отдельных таксономических групп. Одной из таких групп в фауне Республики Дагестан, представляющих научный и практический интерес, является семейство Carabidae. Хотя энтомологические исследования в Дагестане и на Кавказе в целом имеют двухсотлетнюю историю, сведения о фауне, систематике, биологии и экологии жуужелиц весьма фрагментарны.

Жуужелицы - одно из наиболее крупных и разнообразных семейств жесткокрылых насекомых, распространенных во всех ландшафтных зонах. Это определяет их значение как важнейших компонентов сообществ, играющих огромную роль в поддержании природного гомеостаза, в круговороте органического вещества напочвенного слоя и являющиеся прекрасными индикаторами ее гидротермического режима.

Число видов этого семейства по различным данным составляет от 25 000 до 40 000, что делает жуужелиц одним из самых больших семейств не только среди жуков, но и вообще в царстве животных.

В данной работе обобщены личные сборы и наблюдения авторов в разные годы: Абдурахманова Г.М. - 1967-2008гг.; Нахибашевой Г.М. - 1993-2008гг.; Мусаевой Р.А. - 2005-2008гг. Анализ собранного материала позволил выявить для исследуемой территории 386 видов жуужелиц, относящихся к 74 родам (таблица 1.
